

## Assignment #5

**CORRECTED: Due Thursday, 10 October 2019, at the start of class**

This Assignment is based on Chapter 7 material only.

Remember that when you turn in homework problems involving MATLAB/OCTAVE, the following two expectations always apply:

1. The commands that you used must be shown, along with the results.
2. Please strive to minimize use of paper while answering the question.

**Do the following exercises:**

### CHAPTER 7

- Exercise A. **(a)** Consider the system

$$2x_1 + 3x_2 - x_3 = 5$$

$$4x_1 - 3x_2 + 2x_3 = 1$$

$$2x_1 + x_2 + x_3 = 3$$

Perform Gaussian elimination *by hand* to transform it into an upper triangular system. Then do back substitution *by hand*. (Do not swap rows. Full credit requires that the elimination and substitution stages are clear.)

**(b)** The system has abstract form  $Ax = b$ . Enter  $A$  and  $b$  into MATLAB and confirm your by-hand solution by  $x = A \setminus b$ .

**(c)** Let  $M$  be the augmented matrix  $M = [A|b]$  and define

$$L_1 = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}, \quad L_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & -\frac{2}{9} & 1 \end{bmatrix}.$$

Confirm *by hand* that  $L_2L_1M$  is the upper triangular system solved in **(a)**.

The computations in the remaining parts should use MATLAB.

**(d)** Compute  $U = L_2L_1A$  and  $L = (L_2L_1)^{-1}$ . Confirm that  $LU = A$ .

**(e)** In section 7.2 it says "... to solve  $Ax = b$ , one first solves the lower triangular system  $Ly = b$  (to obtain  $y = Ux$ ) and then the upper triangular system  $Ux = y$ ." Using  $U$  and  $L$  from part **(d)**, confirm that you get the same answer this way as in **(a)**.

- Exercise B. **(a)** Open a new m-file called `gebasic.m`. Type in the code from section 7.2, at the top of page 137, labeled “Gaussian elimination without pivoting”. You don’t need to type in the comments, but be careful with the loop indices and other details. Note that, for the code to run, the variables `n`, `A`, `b` must be defined and of the right size.

**(b)** Consider the  $4 \times 4$  linear system  $Ax = b$ :

$$\begin{array}{rcl} x_1 + 2x_2 + 3x_3 + 4x_4 & = & 7 \\ 2x_1 + x_2 & & -x_4 = -1 \\ x_1 & & + x_4 = 4 \\ 2x_2 - 2x_3 & = & -8 \end{array}$$

Run `gebasic.m` on this example. Show the resulting `A` and `b`. (*These will be different from the ones you typed in!*)

**(c)** As a result of part **(b)**, the system is now upper triangular. Solve it using MATLAB. (*That is, use the transformed `A` and `b` and solve the system in an efficient way.*)

**(d)** Confirm using `A \ b`, on the *original* `A` and `b` that you have the correct solution in part **(c)**.

**(e)** Assuming `x` is what you computed in **(c)**, and `A` and `b` are the original data, confirm using `norm(A*x - b)` that **(c)** was correct.

- Exercise 2 on page 175.
- Exercise 3 on pages 175–176.
- Exercise 4 on page 176.
- Exercise 6 on page 176.
- Exercise 8 on page 176.
